Patient Assessments

The FACIT Measurement System is a collection of QOL questionnaires targeting the management of chronic illness. "FACIT" (Functional Assessment of Chronic Illness Therapy)

Patients answer multiple assessments at once

Choose appropriate tools for your research. For instance, patients answer the FACT-G general cancer health then the PHQ-9 depression scale.

Data is ready for SPSS analysis of depression's affect on general health of cancer patients.

The FACIT G is a 27-item compilation of general questions divided into four primary QOL domains: Physical Well-Being, Social/Family Well-Being, Emotional Well-Being, and Functional Well-Being.

The FACIT-G is considered appropriate for use with patients with any form of cancer, and has also been used and validated in other chronic illness conditions (e.g., HIV/AIDS and multiple sclerosis) and in the general population (using a slightly modified version).

There are over 40 different FACIT scales and nine symptom indices. Equivalent foreign language versions of the FACIT questionnaires are now available in more than 45 different languages (for some scales), permitting cross-cultural comparisons of people from diverse backgrounds

Procedure

1. Administer test in the hand-held tablet
2. Communication base sends data HIPAA compliant
3. Provider receives the **FACIT** lab report
 - Research data is instantly available world-wide via web
